

Fund Overview

Investment Objective

AmSustainable Series - Climate Tech Fund (the "Fund") seeks to provide long-term capital growth.

The Fund is suitable for Sophisticated Investors¹ seeking:

- potential capital appreciation over a long-term investment horizon; and
- participation in the global equity market.

Note: ¹Long-term refers to a period of at least five (5) years.

Any material change to the investment objective of the Fund would require Unit Holders' approval.

This material is not intended for non-sophisticated investors. ¹Please refer to the definition of "Sophisticated Investor" in the Information Memorandum.

Note: There is no record of the Fund's performance for five (5) years as the Fund was launched in less than five (5) years.

The returns presented are net of all relevant fees, charges, and costs associated with the wholesale investment. These may include, but are not limited to, management fees, trustee fees, and other applicable charges. Over time, such fees and charges can materially reduce the overall returns on your investment.

It is important to note that the sales charge is deducted upfront and directly reduces the amount of the initial investment that is allocated to the fund, which in turn can have the effect of lowering returns to investors in the long run. These costs may be deducted from your investment amount, from the returns generated, or directly from the Fund's assets, and are reflected in the unit price (NAV per unit). This includes expenses related to the marketing and distribution of the Fund. Additionally, all fees and charges payable to the Manager and the Trustee are subject to applicable taxes and/or duties, which may vary from time to time as imposed by the government.

Given the impact these costs can have on your investment returns, investors are strongly advised to read and understand the contents of the Fund's information memorandum and consider the cumulative impact of these costs before making any investment decision.

Past performance is not necessarily indicative of future performance and that unit prices and investment returns may go down, as well up.

Historical income distribution is not indicative of future income distribution payout. The income could be in the form of units or cash. Unit prices and income distribution, if any, may rise or fall. Where an income distribution is declared, investors are advised that following the distribution the net asset value per unit will be reduced from cumulative distribution NAV to ex-distribution NAV.

Target Fund Manager's Commentary (as at 30 April 2026)

After sharp losses in the previous month, global equity markets rebounded strongly in April, with several indices reaching new all time highs. Early month relief came from a ceasefire negotiated between the US and Iran and hopes that direct talks could lead to a reopening of the Strait of Hormuz. However, geopolitical tensions remain elevated and the strait - through which nearly a quarter of global oil trade flowed before the conflict—remains largely closed, keeping oil prices at high levels. Despite energy driven inflation concerns, the US Federal Reserve left interest rates unchanged. Recent geopolitical tensions highlight a structural shift in the energy transition: clean power is increasingly a pillar of energy security rather than a secondary climate lever. Record solar and wind additions in 2025 now generate electricity volumes comparable to major fossil fuel chokepoints, and real time data shows recent supply disruptions were absorbed mainly by renewables and electrification rather than coal—highlighting clean energy's growing role as a system stabilizer. At the same time, renewables reached a global inflection point, with nearly 700_GW of new capacity added in 2025, lifting their share close to 50% of installed power capacity and overtaking coal in electricity generation. This scale lowers emissions intensity, improves resilience to energy price shocks, and reinforces the investment case for grids, storage, and electrification as core transition enablers. US and emerging market equities recorded the strongest gains, driven mainly by the IT sector. The S&P 500 rose 10.5% and the NASDAQ gained 15.3% (both in USD). The MSCI Europe advanced 5.4% and the DAX 7.1% (both in EUR). Japan's Topix gained 6.6% (JPY). Emerging markets rose 14.7% (USD). Large-cap technology stocks, particularly semiconductors, led performance. Heavy investment in AI-related data center capacity remains the key equity market driver. Energy and healthcare stocks were the main laggards.

The strong performance of clean tech equities is not merely cyclical, but reflects a structural shift in the global energy and economic landscape. Geopolitical tensions and recurring supply shocks have once again elevated energy security to a top political and economic priority. Across Europe and Asia, the expansion of domestic renewable energy capacity is increasingly viewed less as a climate policy tool and more as a key pillar of economic resilience, supply security and geopolitical sovereignty. Structural demand drivers remain firmly intact. Electricity demand is rising sharply, driven by data center and AI infrastructure expansion, electrification of transport and industry, and ongoing reshoring of manufacturing. Power grids are already operating near capacity in many regions, resulting in higher congestion costs, renewable curtailments and greater price volatility. This underscores the urgent need for sustained investment across the entire power value chain—from generation and transmission to distribution networks, transformers, power electronics, storage and monitoring software. Renewables continue to benefit from both economic and strategic advantages. Utility-scale solar and wind remain among the fastest and most cost-effective sources of new power generation globally, while hyperscalers' willingness to pay premium prices for clean, firm capacity further strengthens project economics. Energy storage is increasingly emerging as a critical system enabler, supporting grid stability, load shifting and security of supply. Technological innovation continues to accelerate adoption. Advances in battery chemistry, charging speeds and system integration are improving the economics of electric vehicles, stationary storage and distributed energy solutions. While valuations have recovered from their 2024 troughs, we believe this is underpinned by high order visibility, scaling benefits and improving cost structures, supporting solid earnings momentum across the sector.
